

LEITWIND LTW90: THE WIND TURBINE SUITABLE TO EVERY APPLICATION

In this historical period characterized by a major climate, pandemic and geopolitical crisis investing in renewables turns out to be the best choice in terms of environmental benefits, energy efficiency, cost reduction.

LEITWIND, the only Italian manufacturer of Megawatt class wind turbines and the Italian market leader in the 200 - 1,000 kW category, works in order to achieve all these objectives by enhancing its research and development efforts to build state-of-the-art wind turbines specifically designed for small wind farms (up to 10 wind turbines) and single-turbine wind projects. In fact, LEITWIND recently introduced the LTW90 and LTW80 models with a power rating of 500 kW to meet the current market need for fast permitting processes without compromising power output.

The LTW90 wind turbine stands out particularly among its competitors and can be considered the flagship product of LEITWIND's product portfolio because thanks to the large rotor diameter, even in areas with medium or low wind speeds, this model stands out among its competitors for its excellent power generation.

The **LEITWIND LTW90** model is available in various configurations:

- **500 kW** — ideal for powering Renewable Energy Communities (RECs) in markets such as Austria
- **1 MW** — LEITWIND most successful product in Italy
- **2 MW** — a optimal solution for repowering projects
